Mono Ruzi

SOFTWARE ENGINEER · BACKEND, PLATFORM, AND AI

Tehran, Iran | mm.74noroozi@gmail.com | +98 914 784 7410 | linkedin.com/in/mohammad-noroozi | github.com/monoruzi

SUMMARY

Python engineer with eight years across trading execution, platform reliability, and LLM infrastructure. Owns the signal path on a copy-trading system moving $2M a month across eight exchanges, has provisioned multi-tenant storage on a 100-node Kubernetes cluster, and constrains model output to a schema a regulator can audit.

EXPERIENCE

Finestel — **Senior Backend Engineer**

Jun 2024 – Present

Remote · Crypto copy-trading and trading automation · team of 6

- Owns the signal-bot execution engine: ~25K TradingView webhook signals per day, from sizing and precondition checks through placement and post-fill callbacks, across spot and futures.
- A unified order-management layer fronts eight exchange SDKs (Binance, Bybit, Bitget, OKX, KuCoin, Kraken, Gate, Hyperliquid), so rate limits, error normalization, and broker tagging stay in one place.
- Eliminated concurrent-fill races with Redis distributed locks on trade callbacks, DCA take-profit calculation, and balance updates; order-duplication incidents fell to near zero. Self-healing reconciliation cut stuck-position incidents that needed manual intervention by **~75%**.
- Cut p95 on the heaviest list endpoints from **2.1s to 380ms** with select_related and prefetch_related restructuring, conditional annotations, and an in-process TTL cache for hot reference data.
- Operates a WebSocket streamer fleet at **20M+** events per day and 99.9% uptime: one private socket per account, applied through a classify, queue, apply pipeline on dedicated Celery queues.

Independent — **Technical Consultant**

2019 – Present

Remote · Freelance, concurrent with the roles below

- Advises 10+ companies on architecture and CI/CD (GitLab CI, Jenkins). AWS accounts (EC2, S3, RDS, Lambda) are defined in Terraform, CloudFormation, and Ansible, with alerting on Prometheus, Grafana, Loki, and ELK.

Dirichlet — **AI Platform Engineer**

May 2026 – Sep 2026

Remote · Part-time · Traffic-arrangement planning, Swedish market

- Led the design of an LLM autofill pipeline that turns a work-order email plus geospatial context into a Swedish regulatory survey and a 22-item risk matrix, taking a three-hour manual step to **under 15 minutes** for 40+ planners.
- Defined a strict JSON schema over the OpenAI Responses API and a deterministic post-processor, so model output cannot leave the approved option set. About 22 codified safety rules run beside the model, for answers a regulator can challenge.
- Grounded generation in concurrent OSM, Overpass, and Swedish NVDB lookups, assembled into typed JSON. SHA-256-keyed Redis caching removed **~60%** of repeat calls to those geodata APIs.

Yarai — **AI Platform Engineer**

Dec 2025 – May 2026

Tehran · Contract, part-time · Self-hosted LLM platform

- Designed and built a self-hosted inference platform on Kubernetes, KServe, and vLLM, serving five production models up to 27B parameters on NVIDIA GPUs, with 32K context windows and autoscaling replicas.
- Standardized access behind a LiteLLM gateway with Postgres-backed keys and Redis response caching, one API surface for internal teams across self-hosted and external providers. Images promoted from GitLab CI through Harbor into ArgoCD on bare-metal Kubernetes (Kubespray, Ansible, Istio).
- Architected a multi-tenant assistant platform for five branded products (Yar, Medhoush, Dadhoush, Delyar, and an internal CRM assistant) on a localized Open WebUI fork with Keycloak SSO, across 127 Helm charts and 28 ArgoCD applications.

Hamravesh — **Site Reliability Engineer** Sep 2023 – Jun 2024

Tehran · PaaS platform

- Provisioned multi-tenant S3 on SeaweedFS across a **100+ node** cluster holding **40+ TB**. CDK8s generates the manifests, FastAPI serves the provisioning API, and ScyllaDB backs the service.
- Replicated objects asynchronously to MinIO and AWS S3, with replication status in Grafana via Prometheus.

Mofid Securities — **Backend Developer** Jan 2022 – Sep 2023

Tehran · Bourseview, Iran's largest stock market data platform (~1 TB)

- Built BV-Chart (FastAPI, TradingView standard) on ClickHouse and cut historical query time by **50%**.
- Diagnosed Gunicorn workers exiting on response timeout. A Sentry decorator on the JRPC endpoints exposed an N+1; removing it made that endpoint **10×** faster.
- Four legacy frontend projects on bourseview.com carried no test coverage; all four were migrated to typed, Cypress-covered code. A micro-frontend split then raised page-load speed 30% and cut development time 20%.
- Audited the Pyramid login flow and fixed defects in token encryption and PKCE verification. Cluster delivery moved to ArgoCD; Envoy handled load balancing and circuit breaking.

Homeca.ir — **Tech Lead** 2019 – 2022

Tehran · At-home health services marketplace

- Owned the system as technical lead: Django and Django REST Framework, Next.js, Kubernetes, and observability on Sentry, Prometheus, Grafana, and Loki.
- Shipped a Next.js static CMS on Cloudflare (A+ GTmetrix) and 100+ design-system components. GitLab CI, via Kaniko, gated rolling updates on unit tests so production deploys held at zero downtime.

PROJECTS

Optimalist Mar 2024 – Present

TypeScript, Bun, MongoDB, Pinecone · solo, in production

- Built a Telegram quiz whose questions live in git: chat actions launch coding agents, a merged pull request is served automatically, and **220** tests cover ~8.3K lines through injected MongoDB, in-memory, and GitHub-API stores.

cdk8s-seaweed-s3 2024

Python, CDK8s · github.com/mm74noroozi/cdk8s-seaweed-s3

- Open-source counterpart to the Hamravesh storage work: SeaweedFS S3 topology defined in Python, with a FastAPI service for dynamic namespace provisioning.

SKILLS

Languages	Python, TypeScript, SQL, JavaScript, Go (maintenance), Bash
Backend	Django, Django REST Framework, FastAPI, Pyramid, SQLAlchemy, Celery, Pydantic, Redis, RabbitMQ
Data	PostgreSQL, PostGIS, MariaDB, ClickHouse, MongoDB, ScyllaDB, SQL Server
AI	vLLM, KServe, LiteLLM, OpenAI API, structured output, RAG, grounding, LLM agents
Infrastructure	Kubernetes, Docker, Terraform, Ansible, ArgoCD, Helm, Istio, Kubespray, AWS, Cloudflare
Observability	Prometheus, Grafana, Loki, VictoriaMetrics, Sentry, ELK, OpenSearch
Frontend	React, Next.js, Cypress, design systems
Spoken	Persian (native), English (advanced), Turkish (intermediate)

EDUCATION

Sharif University of Technology — M.Sc. Bioelectrical Engineering 2018 – 2020

Sharif University of Technology — B.Sc. Electrical Engineering 2014 – 2018
